### **Accessibility Report Summary (Implemented Changes)**

To test my website's accessibility, I sent the already published link in my GitHub repository to my classmate Jahswill Enebeli, and he sent me his so we both made a report about each other's websites and how they could be improved in accessibility matters. One of the suggestions provided was changing some of the text and background colors as their contrasts might confuse users when differentiating background from text, so I applied them in hopes of giving potential users a smoother experience and avoiding confusion while navigating my website. Another change I made was enabling users to navigate through my website using the keyboard. While using the Tab key, it initially went to a video I embedded previously but it automatically skipped the hero-image and content containers, so by adding the *TabIndex* attribute on my index (HTML file), equaling it to 0, and testing it, I am giving users with motor issues to navigate through my website using only the keyboard.

In addition, my classmate also pointed out that the format of the images displayed on the cards should be replaced, as they were too heavy to load. So, by using Adobe Photoshop, I changed the images' format, as well as by adding the *Loading=lazy* attribute in the images in the HTML file. This will prevent delays in loading them.
